Anyone know where I can download I googled a search and the one site that Heres the link to the PDF A good photographer does the math and doesnt waste either.. Galen Rowell I never use it, but you would stand at camera position and point the opening at your subject for a reading. It used to be the pro standard, and there are still some of them around doing yeoman service. I would look for a PDF of the manual, but I havent been able to find one doing a quick search. Too bad. Not that theres that much to learn Set your ASA ISO on the dial bottom right, lock button is on the back. Top left is a switch Ex. From there, the only variable you have to set is your shutter speed on the TIME dial. Beware that you can only do flash readings when this dial is set to the white numbers. Now the MODE switch top is for ambient light AMB, as I recall. Plug your sync cord into the meters socket. Position the meter, push the button, the flash will fire and your correct aperture will display. I used to use this for view camera photos of product. You will likely never need it. When reading flash, any ambient light present is included in the reading, so fill flash readings are easy. You know the batteries are getting low if you turn it on and not all of the elements of the LCD display light up. Thats the basics, other than the little bias dial on the back. This is used for calibrating the meter. Dont touch it unless you have some reason to believe the meter is reading improperly. I recall it is calibrated in stops. I likely have the manual around somewhere I never throw that stuff out. Thanks for information.

I want to start using a light meter to get exposure right on faces while blowing the background and have an old Bowens SSR MK II Flashmeter. Is this any good I cant afford a decent light meter at the moment and wondering apart from its age is it a good piece of kit. I mean flash is flash right so would this still give me an accurate reading. Also would anyone know where i could find a manual for it as i know not how to use itbonk cheers in advance If you could post a picture of it on here, that may help If you could post a picture of it on here, that may helpThe incident light reading on mine was spot on. ISO is the same as ASA American Standards Association which your meter uses. Go to the subject and place the meter immediately in front of the subject. Your meter has a flat receptor ideal for flat artwork but less than ideal for 3dimensional subjects so you will have to point it directly at the key light to get an accurate reading. You will have to press one of the buttons to prime it for a reading, then fire the flash and read off what I assume to be the aperture, Im guessing that one of those pink bits will light up to indicate the aperture. Trial and error should tell you which buttons do what. By continuing to use this site, you are consenting to our use of cookies.

I havent had had a flash meter in a long time. My cine meters have gotten me by outside, the interior film projects I have lit tungsten using OPM, and most of the other stuff Ive done inside was Dyounowat, so Ive got by there with the in camera metering. Im not going to use it as a meter. The day is coming where I will never have to pick up the damn thing again. I dont like combi meters. I like simple. Old is fine, new is fine. Ill be looking mostly for an incident meter, but I wouldnt mind hearing about spots as well. What do you use What do you like about it. What sucksIIIF IVF I dont

remember the model but any of the Minolta meters were considered really good back in the last century. Second Sekonic. Haven't found any reason to upgrade to a newer meter, which would only add features that aren't really necessary averaging, memory, etc.. It works great, and I can leave the flash meter with the flashes. In the USA, I think it is called a Luna Pro SBC. If I were to buy new, I'd probably look long and hard at a Gossen digiflash, because I like the size. Matt If you want spot in addition, look for a used Sekonic 408. It has a 5 degree spot as well as incident and reflected metering. Another good used option is a Minolta Spotmeter F. It is a dedicated 1 degree spot. It just works, simple as pie. I have a Multipro and have had an ultrapro, and numerous Minoltas, yet in a studio environment, I fall back to the Ascor. erie The 558 if you do. Used prices on the 358 seem high to me. The 558 is so new that finding used would be tough. Haven't found any reason to upgrade to a newer meter, which would only add features that aren't really necessary averaging, memory, etc.. Click to expand. It's a really reliable workhorse. Best, rory I've had mine at least 20 years, and it's never failed me. I've also got one of the old analog Luna Pro F meters. nice. Has all the little Zone System markings and everything else right on the dial computer thingy. but it is a bit chunky by comparison.

See The user manual can be found here It does incandecent, reflective and flash metering. Its compact, easy to use, accurate and it still runs on the first AA battery. Highly recommended. Its my main meter that I compare everything else against. Does reflective, ambient, flash and multiple flash. I believe this meter was discontinued a couple of years ago but you can still find them new sometimes. It is a simple, straightforward incident meter with a rotating head making it easy to place. It will work corded or cordless. Mine has been utterly reliable for years. I've searched, diligently, to find a repair shop, to work on the Ultra Pro. I have not received answers from all my inquiries yet and any advice regarding a good, reliable repair shop, will be GREATLY appreciated. In the meantime, back at the Ranch. I have NO idea why I would want the USB interface to my PC, as afforded by the Sekonic 758 series. Simple, reportedly reliable and accurate. I will be listening, intently, to ALL. I've searched, diligently, to find a repair shop, to work on the Ultra Pro. I have not received answers from all my inquiries yet and any advice regarding a good, reliable repair shop, will be GREATLY appreciated. In the meantime, back at the Ranch. I have NO idea why I would want the USB interface to my PC, as afforded by the Sekonic 758 series. Simple, reportedly reliable and accurate. I will be listening, intently, to ALL. The 308 IIRC lacks aperture priority readings. I think it also lacks a few other minor things but I may not be remembering correctly. The 358 wasn't much more at the time. Today the 558 adds even spot. The USB cable can be used for film curves too. I think it's the sort of thing some one with years of experience does in their head. I plugged the cable in once or twice to see if it worked then decided it was too much effort to figure out at the time. Update Figured it out, flashmeter working good! I suspect Jason the OP has settled on a flash meter by now.

www.communityheroesproject.org/wp-content/plugins/formcraft/file-upload/server/content/files/1626fbb7ce6096---bose-l1-manual-download.pdf

I have been tempted but have not yet committed as it seems to do everything including making the coffee. I was wondering, when you just want to take simple incident flash readings, how much does this thing help and how much does all the technology get in the way. Thanks Martin The Wein is as simple as it gets and inexpensive. If I were buying one today, I would be interested in one of the Sekonic meters Click to expand. Something to think about if you are planning studio work with strobes. Something to think about if you are planning studio work with strobes. Click to expand. Something to think about if you are planning studio work with strobes. Click to expand. In case others are looking for ideas, I might second the L718 Sekonic that was mentioned in one of the responses. I've had mine for many years, bought new after reading a very glowing review. It has been rock solid, uses common alkaline AA batteries and has many functions and accessories. Its very

intuitive and easy to use. I see them slip through eBay at very affordable prices, too. Im attaching an old ad that summarizes its features. It has two count them thingies EI setting, and a button to fire the flash via synch cable. IMO, best flash meter ever, because that's it. It's the closest flash meter equivalent to the Sekonic Studio Deluxe incident meter that I have used. Click to expand. Click to expand. The image could be pretty misleading as film shoulders and toes are curved compared to the virtual absence of shoulder and toe in digizmos. I suppose if one got used to it ala polaroid as a proof medium it could be useful, but only as a proof shot, not really as a meter. Probably would be most useful for chrome shooters, much less so for negative, in my opinion. I'm auctioning a Bowens Flashmeter III The Flashmeter III, although mainly designed for flashlight serves as well as a continuous light meter.

Actual manufacturer isn't Bowens but Sekonic; this model being in fact almost a clone of the Sekonic Digiflash L458. The only difference between them is a slightly different arrangement of the front buttons below the LCD display. Serial number 809095 Working condition is flawless. Aesthetics are good. There's a shallow scratch on top of the lumisphere and a few superficial signs of use in the casing. The leather case is also in fine condition. Please, contact with me before taking any action. When the destination country is outside the EU, the buyer will be responsible for any possible Custom taxes or fees. Feel free to ask any questions you'd have about the article or the auction. Thanks for looking. You are the light of the world.
